

## DATABASE CONNECTION (Microsoft Access Driver (\*.mdb))

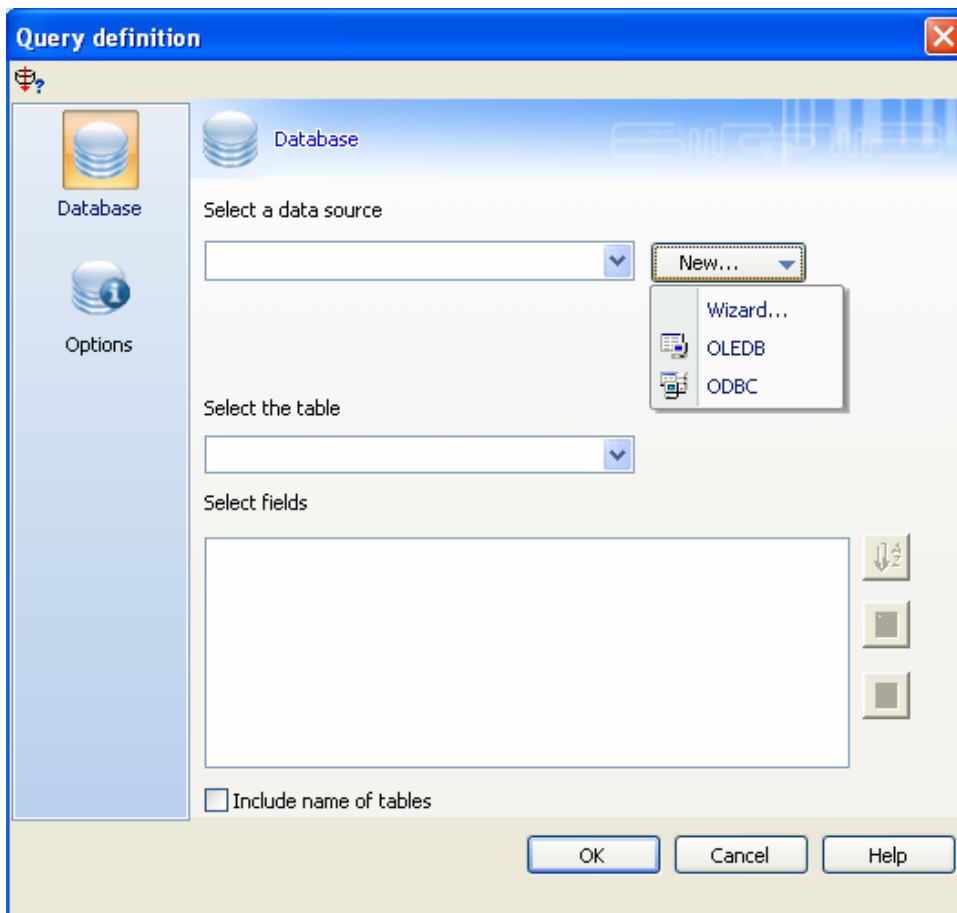

Select “Data sources → Database”

Select “Create/Edit query...” and will show the following window

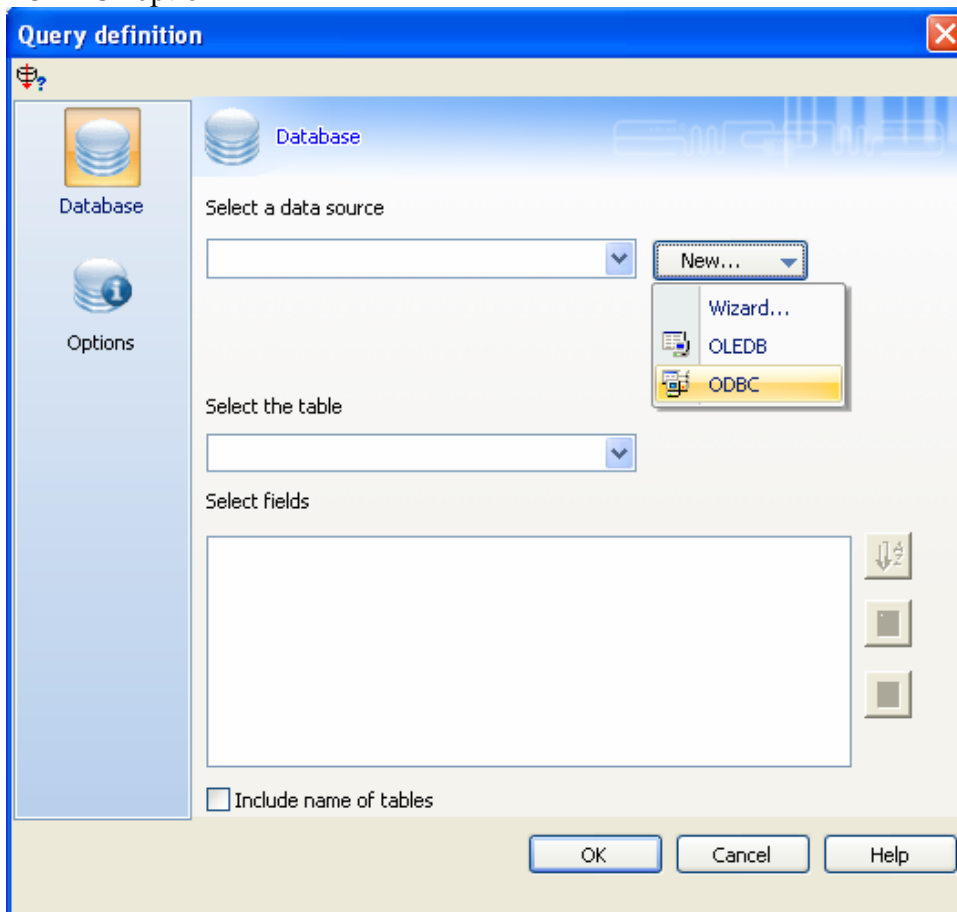

Press “New...” and will show 3 options

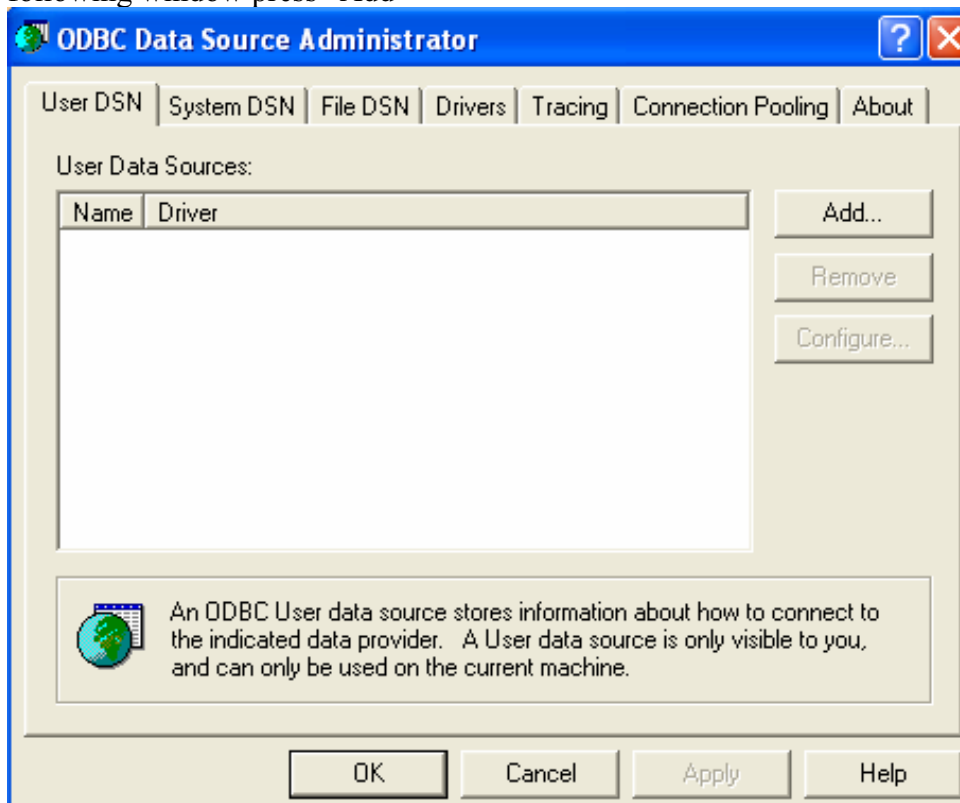

At this point it has the option of using the wizard offered by the program through the "Wizard ..." option and follow the steps that will indicate.  
On the other hand it is possible to merge database manually continuing with this guide.

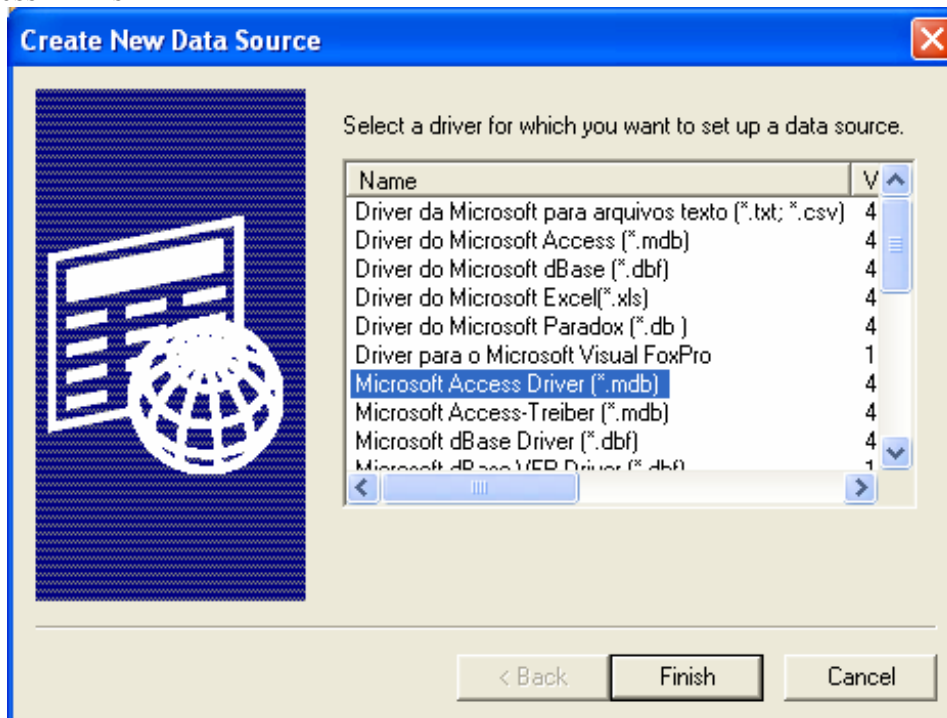

Select “ODBC” option

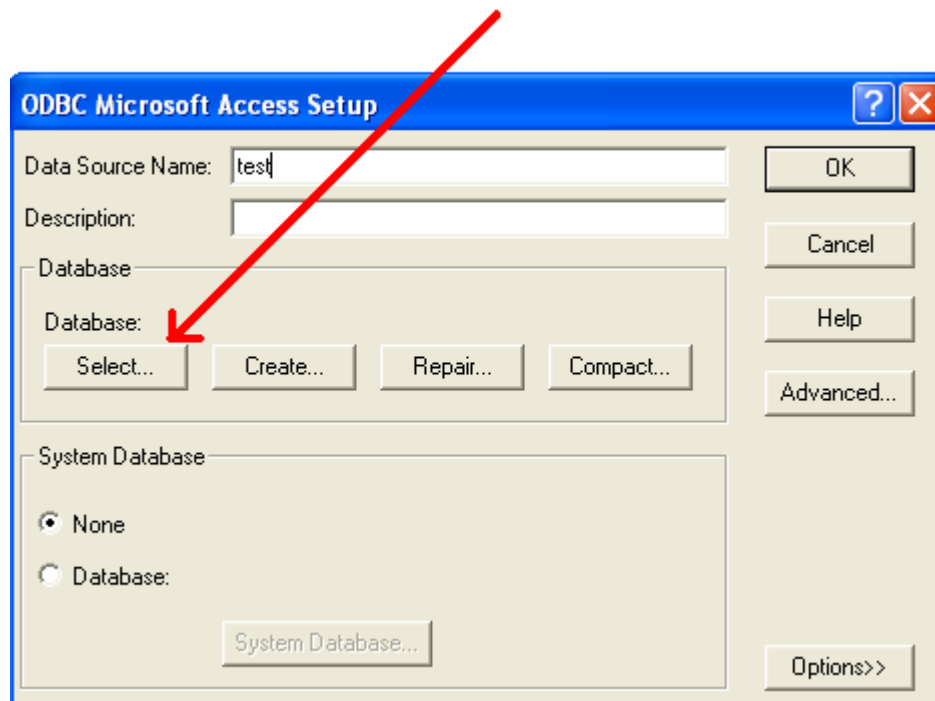

In the following window press “Add”

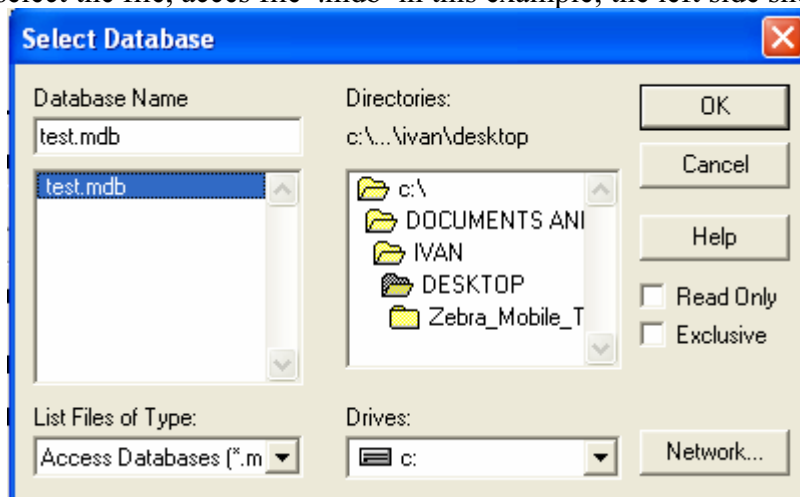

Select needed ODBC connection type. Microsoft Access Driver in this example (\*.mdb) and press “Finish”

In “Data Source Name” write the merge name and press “Select”

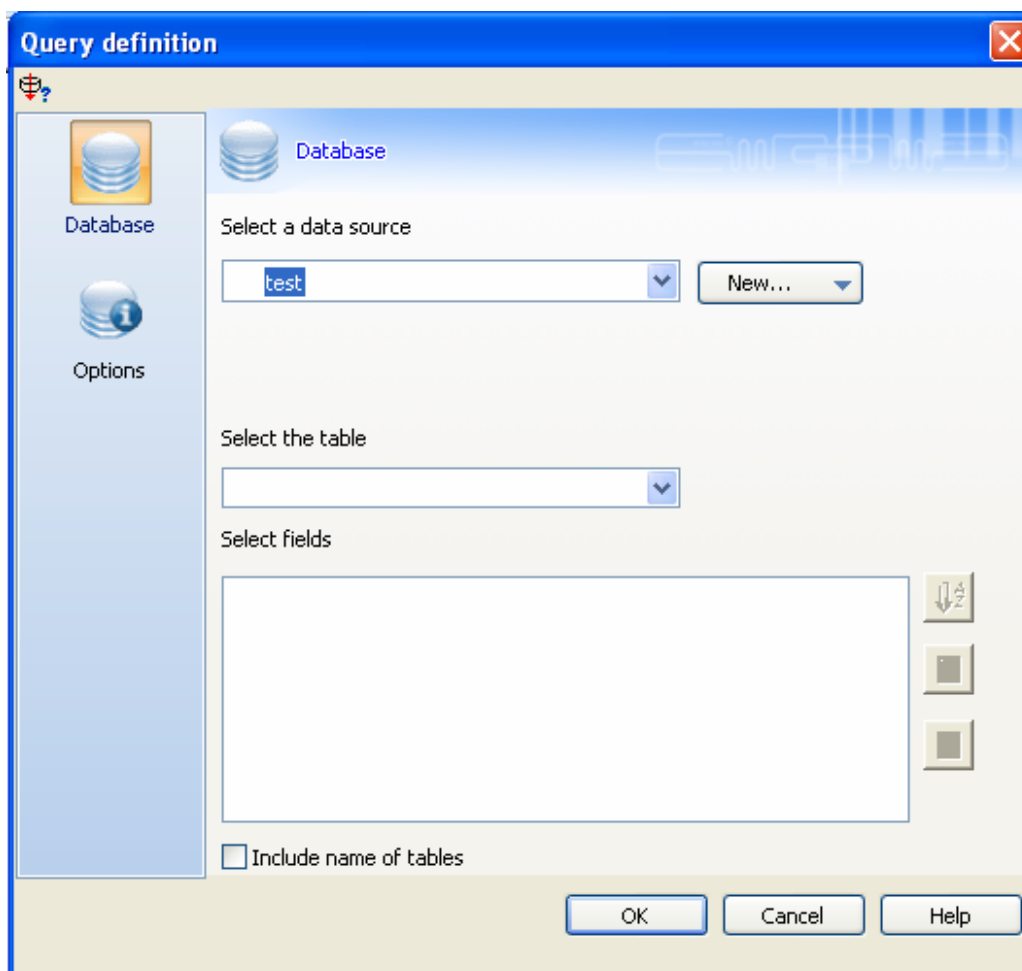

Search and select the file, access file .mdb in this example; the left side shows the files

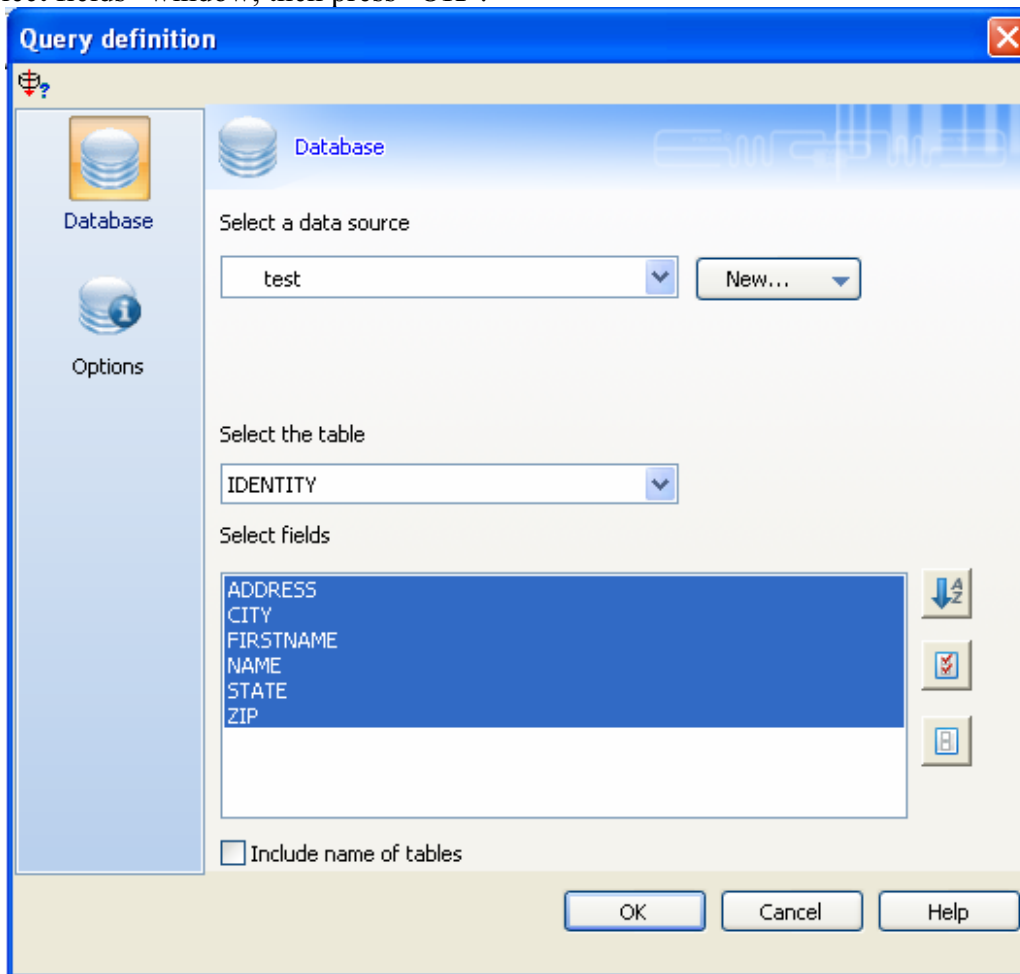

Select the file and press “OK”. In the following windows press “OK” until to return to the Sinelsoft window.

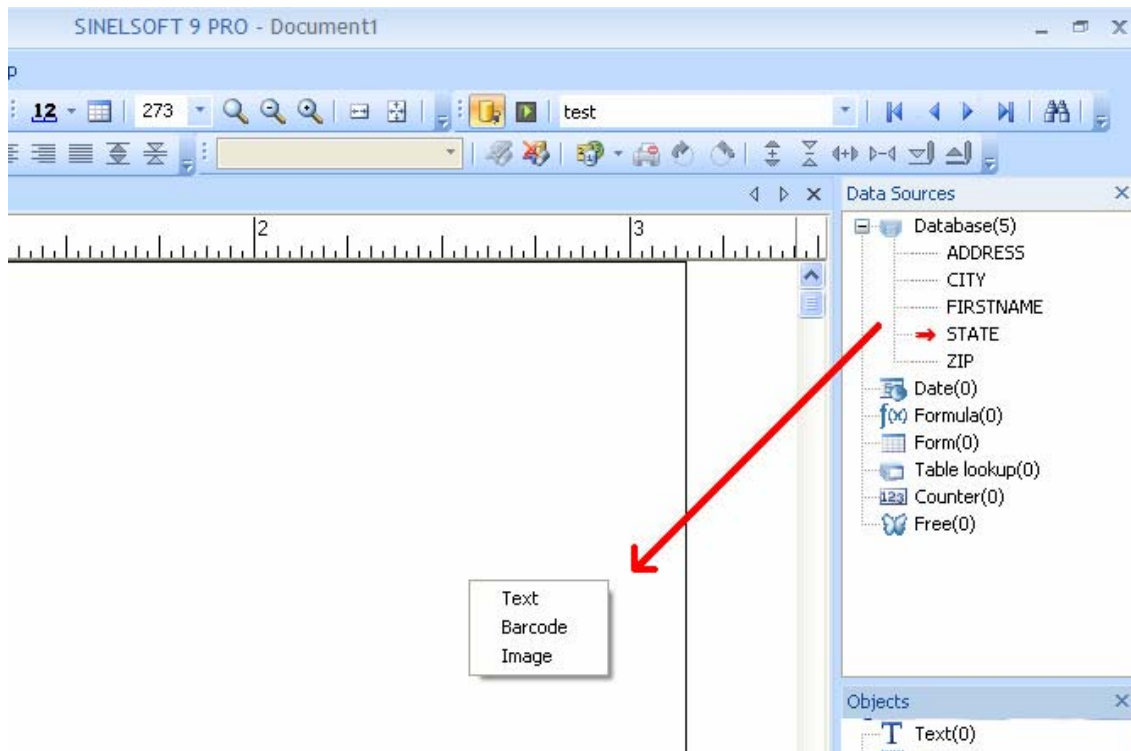

Press on the “Select a data source” drop-down list and select the data source created, “test” in this example.

Press on the “Select the table” drop-down list and select the table and select fields in the “Select fields” window, then press “OK”.

Now, the selected fields are available in "Data Sources" window in the main software window.

The last step is to drag and drop the desired field from the "Data Sources" window into the document. Releasing it must choose if the data will be represented as text, bar code or image.
